

XCOVID

Diagnóstico de COVID por
classificador de rede neural de
Raio-X pulmonar

Sumário

- **Apresentação do Grupo**
- **Motivação**
- **Rede Neural**
- **Resultados**
- **WebApp**
- **Perspectivas Futuras**
- **Referências**

Grupo

Luís G. Cattelan

Mateus Guimarães

Marcos Tidball

Motivação

PCR-RT é o principal meio de diagnóstico para COVID, entretanto:

- Caro
- Demorado
- Necessita de insumos especiais

Motivação

O vírus ataca principalmente o sistema respiratório

Afeta o pulmão logo no início da infecção

18% dos casos não severos e **2,9%** dos severos não apresentam anomalia em exames de Raio-X

Ainda assim, estudos mostram que exames de Raio-X podem ser usado para diagnóstico de pacientes.

Motivação

Qualidades do Raio-X pulmonar:

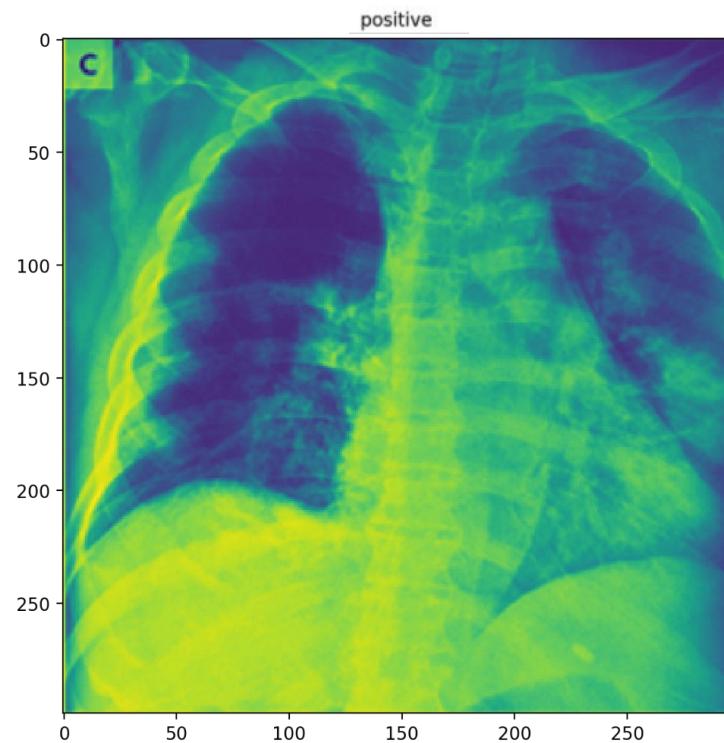

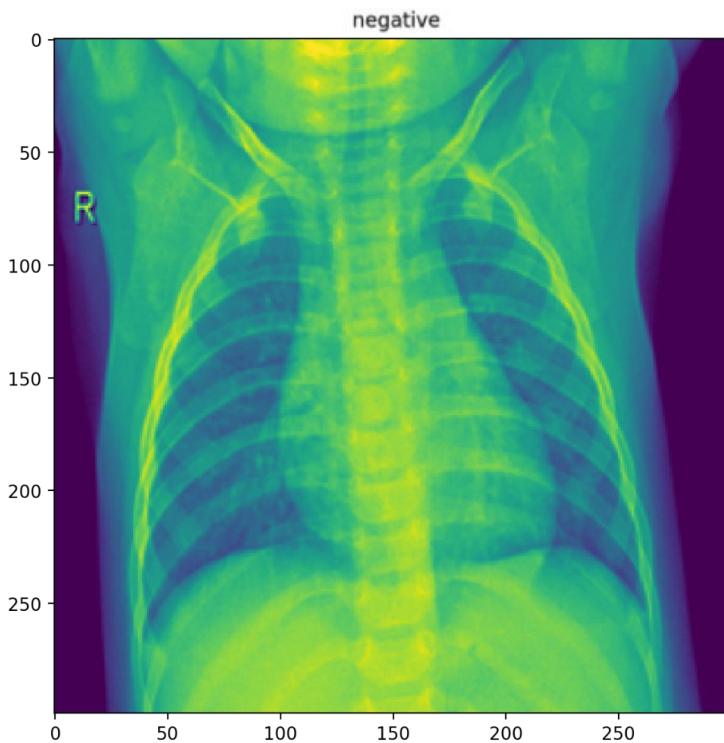

- Rapidez
- Disponibilidade

Literatura

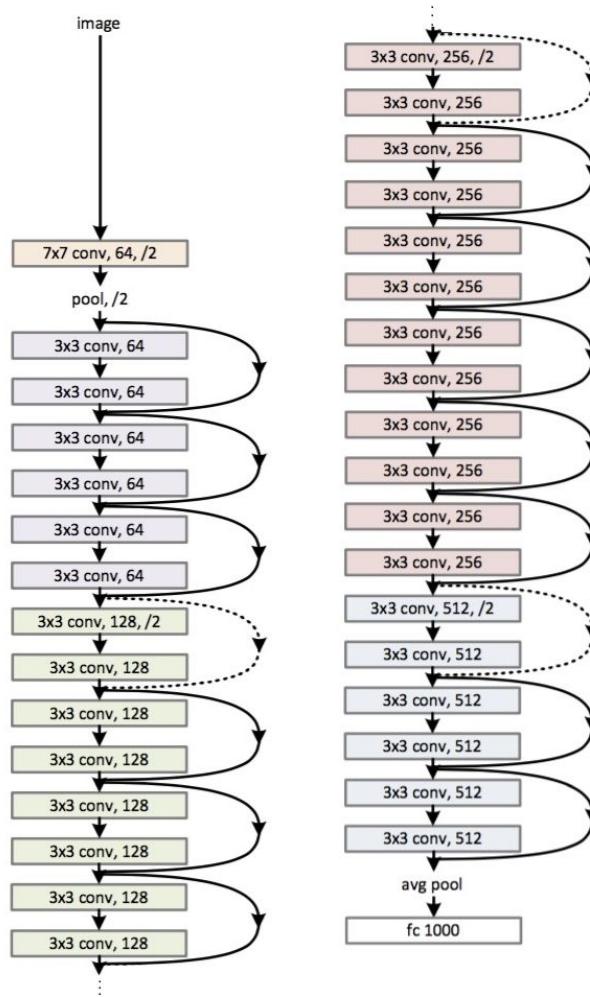

Table 1 Related work summary

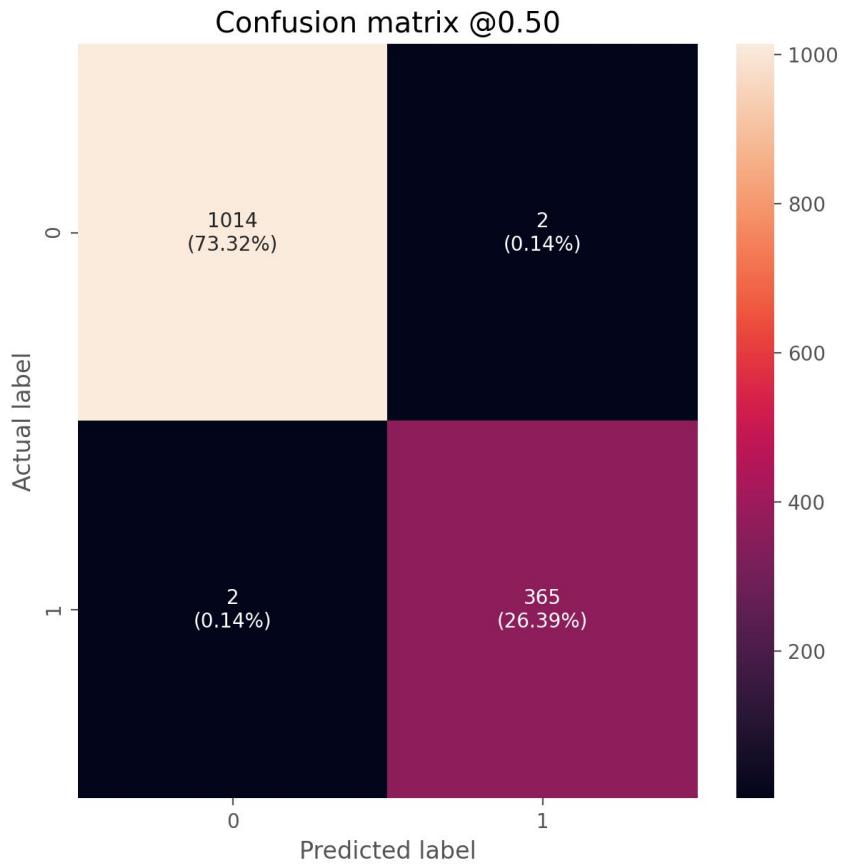

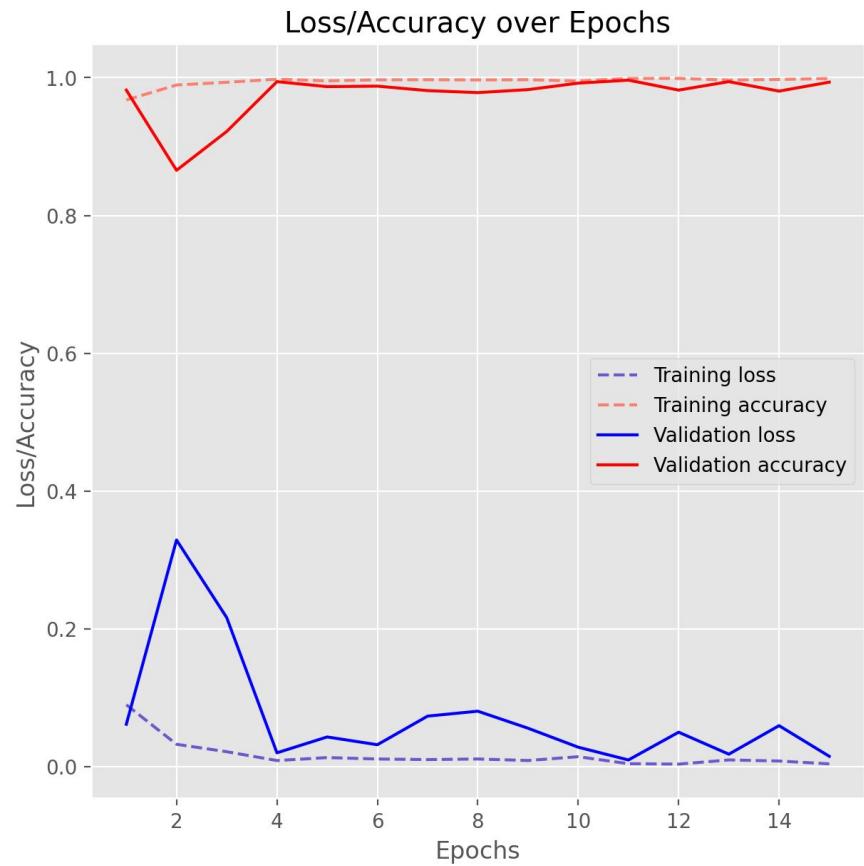

| Related work | Technique | Dataset | Accuracy (%) |
|--------------------|-----------------------------|--------------------|--------------|

23.    m = {0: 'COVID-19 Negativo', 1: 'COVID-19 Positivo'}

```

Perspectivas futuras

- Melhorar a rede
- Mais classes (pneumonia, tuberculose...)
- Severidade da doença
- Colocar o site no ar

Extra:

XCOVID

In this project we created a transfer learning based COVID-19 lung x-ray classifier WebApp for the [Scitek - POATEK Datathon!](#)

In order to run it, just follow these instructions:

1. Clone the repository with `git clone https://github.com/gfc-fiscomp/x covid.git`.
2. Get into the repository directory with `cd xcovid`.
3. Type `streamlit run app.py` on the terminal. A localhost instance should then open up in your browser! (note: the website is entirely in Brazilian Portuguese)

The model used for image classification is a ResNet50 pre-trained with ImageNet weights that was finetuned using the images provided in [this dataset](#) (given to us by the datathon organizers). In order to learn more about how the model was trained, check out the `rede.ipynb` file over [here](#). We had to deal with a very imbalanced dataset! The communication between the WebApp and the model is made possible by `call_model.py`, which can be seen over [here](#).

Here is the classifier's confusion matrix on test data:
